## 1.0 BACKGROUND

The Athabasca River is over 1,200 km in length and has a drainage area of approximately 100,000 km<sup>2</sup> (NRCan 2008). The headwaters of the watershed arise from the melting snow and ice of the Athabasca Glacier in Jasper National Park. The Athabasca River then flows northeast across Alberta, through the Peace-Athabasca Delta, and into Lake Athabasca. Approximately 90% of the Athabasca watershed is located within Alberta, with 10% falling within Saskatchewan.

The Athabasca watershed has unique attributes and environmental concerns. The Athabasca watershed contains several human settlements, including Fort McMurray, Hinton, Whitecourt, Edson, Jasper, and Athabasca, which all have municipal wastewater treatment plants discharging into the Athabasca River. Economic activity in the upper portion of the watershed is dominated by agriculture and forestry, as well as three active coal mines and one closed coal mine in the Edson/Hinton area (ERCB 2010). Forestry occurs throughout the watershed, while oil sands developments dominate the lower portion of the watershed.

The basin has been divided into 10 sub-watersheds for the purposes of this project, as outlined below.

**Table 1 Sub-basins in the Athabasca watershed.**

---

|                             |                           |
|-----------------------------|---------------------------|
| ▪ Upper Athabasca           | ▪ La Biche                |
| ▪ McLeod                    | ▪ Clearwater              |
| ▪ Pembina                   | ▪ Lower Athabasca         |
| ▪ Central Athabasca – upper | ▪ Lake Athabasca          |
| ▪ Central Athabasca – lower | ▪ Lesser Slave (see note) |

---

**Note:** The Lesser Slave sub-watershed has a separate WPAC and completed SOW Report. The geospatial data on the Lesser Slave sub-watershed is presented only for reference and to make linkages with the overall Athabasca watershed. The scope of work for Phase 2 excludes a detailed analysis of the Lesser Slave sub-watershed, given it has already been completed and can be referenced in the Athabasca SOW Report.

### 1.1 SCOPE OF WORK (PHASE 1)

The Government of Alberta has committed to protecting and managing the water resources of Alberta pursuant to the *Water for Life (WFL) Strategy* and *Water for Life Action Plan* (Government of Alberta 2003, 2008, 2009). Watershed Planning and Advisory Councils (WPACs) are designated in the *Water for Life Strategy* as multi-stakeholder, non-profit organizations responsible for assessing the condition of a watershed and developing a plan to address issues identified during the assessment. The Athabasca Watershed Council Watershed Planning and Advisory Council (AWC) was formed in late 2009 and was mandated with the development of a State of the Watershed (SOW) Report for the Athabasca watershed by 2012.

The AWC initiated this process to determine the condition of the watershed in June 2010 with the *State of the Watershed - Phase 1 Project* (“the Project”). The scope of work for Phase 1 included the identification and compilation of information and geospatial data relevant to the Athabasca watershed, to support the production of a public-facing SOW report in Phase 2, as well as development of suggested indicators for use in the final (Phase 2) SOW report, and a draft Terms of Reference document for Phase 2. Hatfield Consultants was retained by AWC to complete these Phase 1 tasks.

Specifically, the Project included the following components:

1. A comprehensive bibliography of non-spatial data (annotated where possible) relevant to understanding the “state of the watershed” (Appendix A1);
2. A preliminary Geospatial Atlas including spatial datasets (i.e., geodatabase), mapping products, and summary tables (Appendix A2);
3. A preliminary assessment of key issues, concerns, and major threats in the watershed as identified in the literature/spatial datasets, leading to the selection of proposed Watershed Health Indicators that may be used in Phase 2 of the Project to assess and track the ecological integrity and health of the watershed, in a final Athabasca State of the Watershed (SOW) Report, oriented toward the public and decision-makers;
4. A data and knowledge gap analysis, to identify information that is currently lacking or unavailable for use in developing a robust Phase 2 SOW report;
5. A draft Terms of Reference (TOR) for Phase 2 of the AWC State of the Watershed Report, which was provided to AWC under separate cover; and
6. A Traditional Ecological Knowledge (TEK) report, summarizing existing data describing the biophysical health of the watershed, including research, monitoring, reporting, and stewardship initiatives, which will be presented to AWC under separate cover.

Items 1, 2 and 5 are presented in Appendices A1 to A3, while the recommended indicators, key threats and pressures, and knowledge and data gaps are presented in the following sections. The bibliography also has been made available as a searchable, online database, as described in Section 2.1.

## 2.0 METHODOLOGY

A brief synopsis of work undertaken for Phase 1 is provided below of each project component. Issues encountered, data/knowledge gaps found, and recommendations for the AWC going forward into Phase 2 are later discussed in Sections 4 and 5.

## 2.1 BIBLIOGRAPHY

The bibliography of science-based information sources encompasses approximately 20,700 references. Materials include government, scientific and other publications, and various spatial and non-spatial data sets, compiled by Hatfield staff through investigation and compilation of current and historical information sources. Materials collected and compiled by Hatfield directly included approximately 220 references (excluding spatial data); where possible, these materials have been obtained in electronic form (typically PDFs) and included on DVD as a deliverable of this project (this includes nearly all references cited in Appendix 1). Where the original reference could not be obtained, or the reference was easily obtainable online, links were provided to facilitate user access. These directly-obtained references are included in the printed bibliography in Appendix A1.

The remainder of references compiled in this database came from the Bibliography of the Athabasca River Basin (BARB), an Excel-based list of references related to the Athabasca River basin, which includes approximately 20,500 entries and was produced by the Athabasca River Basin Research Institute (ARBRI).

As an additional deliverable of this project, a web-served, searchable form of the Phase 1 bibliography – integrating the full BARB database – was developed, and currently (as of March 2011) resides at the following web address:

<http://www.hatfieldgroup.com/AthabascaBibliography>

A search tool has been developed to allow for the full reference list to be searchable by key word.

This website was created using Microsoft.Net programming tools, and uses the MySQL open-source database engine. In the medium to long term, we anticipate that AWC may want to migrate hosting of this database from Hatfield's site to its own website, or to integrate this database with the existing BARB project at Athabasca University, which also has stated an interest in developing a web-served version of its database. Hatfield is available to assist AWC with such a migration if desired.

To host this database, the following systems are needed:

- Microsoft IIS webserver; and
- MySQL database engine.

## 2.2 TRADITIONAL ECOLOGICAL KNOWLEDGE REPORT

A separate TEK report, documenting publicly available sources of TEK with a short written summary, will be provided in a stand-alone report. In addition to being provided to the AWC, it also will be submitted directly to Treaty 8 First Nations of Alberta and Métis Nation of Alberta. This approach, agreed upon with the AWC during scoping of Phase 1, essentially separated TEK non-spatial information from science-based information sources.

The TEK report was compiled by Dr. Brenda Parlee, Assistant Professor and Canada Research Chair, Faculty of Native Studies, University of Alberta.

## 2.3 PRELIMINARY ATLAS / SPATIAL DATABASE

Spatial datasets describing features of the basin were compiled in the Preliminary Atlas, using the following guidance:

- The Handbook for State of the Watershed Reporting: A Guide for Developing State of the Watershed Reports in Alberta (AENV 2008);
- Various government and non-government agencies (specific sources are provided in Table 2, Appendix A2); and
- Relevant spatial data already collected and existing in Hatfield’s internal geodatabase.

Alberta Environment (AWC representative: Richard Chabaylo) coordinated and streamlined efforts to collect data where possible.

Existing geo-spatial data and information were gathered for the select assessment features in Table 2.

**Table 2 Assessment features included in the geodatabase.**

---

|                              |
|------------------------------|
| A. Geology                   |
| B. Soils                     |
| C. Topography                |
| D. Land Cover                |
| E. Meteorology               |
| F. Hydrology                 |
| G. Water Quality             |

| I. Surface Water Use         |
| J. Groundwater               |
| K. Point Source Effluents    |
| L. Land Use Indices – Linear |
| M. Land Use Indices – Area   |
| N. Administrative            |

---

These data were gathered from readily available sources and federal, provincial and regional agencies, including Environment Canada, Natural Resources Canada, Agriculture and Agri-Food Canada, Alberta Geological Survey, Alberta Environment, Alberta Energy, Alberta Sustainable Resources Development, Alberta Biodiversity Monitoring Institute, Alberta Conservation Information Management System, Groundwater Information Centre, and the Regional Aquatics Monitoring Program.

Contact with data providers involved telephone calls, emails, and internet searches. Sources identified in the *Handbook for State of the Watershed Reporting: A Guide for Developing State of the Watershed Reports in Alberta* (2008) were investigated. Contacts and data provided by Environment Canada also were utilized.

Data custodians like GeoConnections, GeoBase, and GeoGratis shared data from government and non-government agencies.

Geospatial data were gathered in a number of formats, including AutoCAD drawing files, ESRI ArcGIS/Arcview shapefile, ArcGIS file geodatabase, ArcInfo coverages, and Microsoft Excel spreadsheets.

### ***Spatial Data Compilation***

Gathered data were reviewed for their coverage (complete or partial) of the study area, their age (current or out of date), their scale (1:2,000,000 or 1:50,000), and the data source (federal or provincial government or private organization).

Where metadata existed, it was organized and is delivered on DVD along with the file geodatabase. As the metadata were written by the original data creator (rather than Hatfield), these metadata exist in numerous formats, including XML, HTML, DOC, TXT, PDF. The completeness of metadata varied widely.

Table 2 in Appendix A2 summarizes the status of each feature in the geodatabase, its data source, coverage and completeness, the scale of the data, and whether metadata exist. As part of the Preliminary Atlas, all GIS data also has been provided to AWC on DVD with associated datasets and metadata, where available (DVD enclosed).

For data compatibility and ease of use, Hatfield has designed and created an ESRI File Geodatabase (version ArcGIS 9.3) to hold all the geospatial assessment features datasets.

Data modifications prior to importing into the file geodatabase included: (a) merging; (b) re-projecting the data; (c) subsetting the data to include only that within the study area; and (d) joining data tables. These steps are described below.

#### **1. Merging**

Tiled datasets like the National Topographic Data Base were combined by merging in ArcGIS.

## 2. Projection

Data were re-projected NAD\_1983\_10TM\_AEP\_Forest. This projection is used by the Alberta government and is useful for viewing data that stretches the width of the province. Details are provided below.

---

## 3. Subsetting

Data were subset by clipping to the project study area. This made the data more manageable and focused on the area of interest. Raster (e.g., DEM, hillshade) datasets were not clipped. In addition, datasets with topology errors were not clipped, because these errors would each need to be resolved before clipping could occur. Some datasets exhibited hundreds of topology errors.

## 4. Joining Tables

Where appropriate, provided attribute data tables were joined to the GIS point/line/polygon dataset with location data only. This was done using a common unique identifier. One example is the soil drainage class dataset.

Note: no topology rules were applied because Hatfield was not the original creator of these data.

### ***Creation of the Preliminary Atlas***

A Preliminary Atlas of maps of created using the contents of the file geodatabase and the assessment features was created, including features listed in Table 3. Printed versions of these maps appear in Appendix A2.

ESRI ArcGIS project files (MXD) for the Atlas maps were delivered on DVD, which also included the file geodatabase and metadata.

**Table 3 Assessment features included in the Preliminary Atlas.**

---

| <b>Features Included in Preliminary Atlas</b>   |
|---|
| A. Geology (geologic era, geologic formation, surficial geology)  |
| B. Soils (local surface form, coarse fragment content, soil drainage class)   |
| C. Topography (DEM, hillshade, contours)  |
| D. Land Cover (classification, wetlands, natural regions, green and white areas, )  |
| E. Meteorology (mean annual temperature, total precipitation, monitoring sites)   |
| F. Hydrology (watershed boundaries, stream flow gauges stations)  |
| G. Water Quality (monitoring stations)  |
| H. Fisheries and Wildlife (point data, species at risk, species present, important bird areas, monitoring sites)  |
| I. Surface Water Use (allocation/withdrawals)   |
| J. Groundwater (allocation/withdrawals, well density)   |
| K. Point Source Effluents (type and volume)   |
| L. Land Use Indices – Linear (pipelines, wells, roads, transmission lines, railway, cut line)   |
| M. Land Use Indices – Area (oil sands Agreement, petroleum and natural gas agreement, metallic and industrial minerals agreement, coal license, coal categories, coal agreement, forest management agreement areas, registered fur management areas (trapline), Canada's forest heritage, converted and accessed forests, Canada's large remaining forested areas, Canada Land Inventory - agriculture/forest potential, parks and protects areas, First Nations reserves, treaty boundary, Land Use Framework Planning Regions, Integrated Resource Plan, Lower Athabasca Regional Plan) |
| N. Administrative (Alberta township/range grid, Canadian geographic names)  |

---

## **2.4 INDICATORS OF WATERSHED HEALTH**

The recommended Indicators of Watershed Health were largely developed through:

- Review of regulatory guidance from Alberta Environment (AENV);
- Review of stakeholder concerns from the AWC-WPAC and Watershed Stewardship Groups;
- Review of SOW reports produced by other WPACs, or similar types of reports produced by others;
- Assessment of current identifiable key anthropogenic threats and pressures, approved and proposed developments, and existing knowledge of the watershed;
- Identification of environmental resources of ecological or social importance that were deemed sensitive to change and could be reliably measured, using best professional judgment; and
- Feedback from AWC regarding on initial draft indicators.

A detailed description of the approach taken with the recommended indicators is provided in Section 3.

## **2.5 DRAFT PHASE 2 TERMS OF REFERENCE**

A TOR for Phase 2 of the Project was drafted based on the outcomes from all other deliverables and in consultation with the AWC and their vision for Phase 2. The TOR for Phase 2 is provided to AWC under separate cover.

## 3.0 INDICATORS OF WATERSHED HEALTH

### 3.1 DEFINITION OF WATERSHED AND WATERSHED HEALTH

“Water” is defined by the *Water Act* as “all water on or under the surface of the ground, whether in solid or liquid state” (AENV 1998). A watershed, therefore, is the area of land where all water drains to the same destination and is defined by highpoints and ridgelines that descend into stream valleys. A watershed may encompass many ecosystems, while a large ecosystem may encompass multiple watersheds. These systems are the product of interactions between the flora, fauna, microorganisms, geological formations such as soil, rocks, and minerals, water sources and the local atmosphere.

The Government of Alberta is committed to the preservation of “healthy aquatic ecosystems” as outlined in its *WFL Strategy* (AENV 2003, 2008). In order to define ‘watershed health’, the terms ecosystem and watershed are used here interchangeably. The concept of ecosystem health emerged from research efforts to document changes in the environment resulting from human activity (Rapport et al. 1998). Generally, the term “ecosystem health” is used to describe an ecosystem’s ability to maintain its structure and function while satisfying potentially stressful human use requirements (Postel et al. 2003, Costanza et al. 1997). For the purpose of State of the Watershed reporting, ecosystem/watershed health is best considered in the context of its ability to “remain sustainable and resilient to stress, and maintain its ecological structure and function over time, similar to the natural (undisturbed) ecosystems of the region, with the ability to recover from disturbance, while continuing to meet social needs and expectations (Stantec Consulting Ltd. 2005). Ecosystem health is the ultimate goal, or endpoint, of environmental management (Cash 1995); implicit to this is that processes important to an ecosystem’s health can be identified and evaluated (Fairweather 1999).

### 3.2 DEFINITION OF WATERSHED HEALTH INDICATORS

Watershed health indicators are focused primarily on the aquatic environment, but also include terrestrial and anthropogenic factors that may relate to aquatic ecosystem health. For example, the physical state of an aquatic ecosystem (i.e., water and sediment quality, habitat features, and hydrological variables) can indicate activities that may be acting as stressors on aquatic organisms – these physical attributes are defined as ‘*indicators*’. Biological indicators such as benthic invertebrate communities or fish populations reflect the overall condition of the aquatic environment and integrate the potential effects of complex and varied stressors over time. Although the term ‘watershed’ suggests an aquatic focus, terrestrial and anthropogenic factors should also be assessed such as biodiversity, water allocations, and municipal and industrial development in understanding the health of a watershed. This provides a more holistic understanding of the ecosystem and potential human effects on it.

### 3.2.1 Types of Indicators

Indicators can either be a single metric, such as pH or dissolved oxygen, or can be multi-metric, such as the River Nutrient Index, which includes a number of water quality variables summarized into a single number (AENV 2008). Furthermore, the nature of different indicators can be classified as follows (Jamison 2009):

- *Condition indicators* address the state of the environment;
- *Pressure indicators* indicate potential to cause negative impacts and describe the natural process or human influences that can impact environmental quality; and
- *Response indicators* describe actions or management plans intended to prevent or mitigate negative environmental impacts.

Each type of indicator is closely related. A *pressure* within the watershed may change a *condition* of the environment, which in turn may result in a *response* (i.e., restrictions on the discharge of pollutants). The most common types of state-of-the-environment indicators are condition and pressure; response indicators describe the state of management actions being taken to address environmental concerns.

### 3.2.2 Selection of Indicators

Due to complex and dynamic interactions between numerous influencing factors, one indicator alone is insufficient to measure the health of a watershed. Instead, a number of indicators are required to provide a representative image of a watershed (AENV 2008). In a report resulting from the Northern River Basins Study (NRBS), indicators of “aquatic ecosystem health” were proposed to be selected for each ecosystem on an individual basis, guided by the nature of that ecosystem and the stressors and issues acting on it (Cash *et al.* 1996). The number and type of indicators required or appropriate for a given assessment will vary, depending on the nature and scope of the assessment. Although the number of possible environmental indicators that could be used is nearly limitless, generally a minimum number of indicators should be used that capture meaningful information about environmental conditions of interest or concern, at a scale relevant to the assessment being conducted.

The selection of indicators for characterizing the health of a watershed is critical. These indicators must be comprehensive enough to capture major components and processes but must also be practical and measurable in scale and frequency. Well-chosen indicators will be measurable and interpretable, objective and comparable, reflective of how well the watershed is functioning, sensitive to stressors, reflective of stakeholder concerns, cost effective to monitor, and can summarize large amounts of information into an easily understood and concise format (AENV 2010). In order to meet all of these requirements an indicator must also be:

- **Relevant:** Has the ability to provide information about the watershed that stakeholders need to know;
- **Understandable:** Is easy to understand by non-technical experts;
- **Reliable:** The information that the indicator provides is trustworthy;
- **Timely:** The information provided is available while there is still time to act (Alberta Environmental Protection 1996 in Aquality Environmental Consulting Ltd. 2009); and
- **Comparable:** Can be evaluated against existing guidelines, thresholds, targets or historical trends, where possible (AENV 2010).

For the purposes of this SOW report, relevant indicators must also have **pre-existing and readily available data**, with appropriate spatial and temporal coverage, given the AWC will not collect new (primary) data for its SOW report.

Regulatory guidance to developing indicators and existing SOW reports for watersheds in Alberta provided direction when choosing the indicators for the Athabasca watershed. Specifically, the draft indicators were developed from the following sources:

- Draft Guide to Foundational Indicators for State of the Watershed Reporting (2010) (Section 2.1);
- The Keepers of the Athabasca Report (2008) (Section 2.2);
- Select AENV WPAC SOW reports for watersheds in Alberta (Section 2.3);
- State of the Aquatic Environment Report for the Peace-Athabasca Delta (2002) (Section 2.4); and
- WPAC member and stakeholder input and concerns:
  - Summary of Stakeholder and Aboriginal Community Concerns from WPAC Development Process (Athabasca Watershed Council, n.d.) (Section 3.7);
  - Watershed Stewardship Group Sector Report #3-Summary Report and Contract/Distribution List (Simmons 2010) (Section 2.5); and
  - Direct input Athabasca WPAC Technical Committee members.

### **3.3 DRAFT GUIDE TO FOUNDATIONAL INDICATORS FOR STATE OF THE WATERSHED REPORTING (DRAFT 2011)**

The *Guide to Foundational Indicators for State of the Watershed Reporting* is being developed by AENV to establish a set of core indicators to be used by WPACs in Alberta when developing SOW reports. These core indicators of watershed health are not comprehensive, but provide a basis for the development of watershed-specific indicators. Recommended foundational indicators include:

- Nutrient concentrations;
- Bacteria concentrations;
- Surface water allocations (withdrawals);
- Variation of annual flow and/or lake levels;
- Flow commitments;
- Groundwater allocations;
- Groundwater well density;
- Land use/land cover;
- Riparian health; and
- Biotic integrity.

These foundational indicators have been considered in the draft list of indicators proposed herein and are included, where applicable to the Athabasca watershed in order to maintain consistency within the province.

### 3.4 KEEPERS OF THE ATHABASCA REPORT

*The State of the Athabasca Watershed Report* was prepared by the Canadian Parks and Wilderness Society (Northern Alberta) for the Keepers of the Athabasca (Walsh 2008). The report was intended as a SOW report and identifies numerous environmental and social concerns in the Athabasca watershed (Table 4), with much of its content drawn directly from other reports. It should be noted that the *Keepers State of the Athabasca Watershed Report* includes downstream portions of the watershed within Saskatchewan, unlike the proposed AWC-WPAC SOW which only includes the Alberta portion of the watershed.

**Table 4 Key concerns expressed in the Keepers of the Athabasca Watershed report (Walsh 2008).**

| Concern                | Activity  | Stated Contaminants / Concerns  |
|------------------------|---|---|
| Human and aquatic life | Pulp mill effluent discharges                     | Increased phosphorus and nitrogen concentrations.   |
|                        | Wastewater treatment facility effluent discharges | Increased nitrogen concentrations.  |
|                        | PCB contamination in Hardisty Creek               | Source of contamination is unknown (Swan Hills facility suspected).   |
|                        | Swan Hills facility effluent discharges           | Dioxin/furan concentrations.  |
|                        | Concentrations of mercury in fish                 | Mercury released by various industries.   |
|                        | Metals contamination due to mining activities     | Elevated selenium concentrations downstream of open pit coal mines (i.e., upper Athabasca, Saskatchewan portion of basin – uranium mining). |

**Table 4 (Cont'd.)**

| <b>Concern</b>                            | <b>Activity</b>   | <b>Stated Contaminants / Concerns</b>  |
|---|---|--|
| Human and aquatic life                    | Contamination due to oil sands activities   | Polycyclic Aromatic Hydrocarbons (PAHs) and naphthenic acids.  |
|   | Arsenic contamination in lower Athabasca  | Elevated arsenic concentrations may be due to various activities (i.e. burning of fossil fuels, oil sands, metal mining, agricultural pesticide application, burning of waste, etc). |
|   | Pesticide contamination   | Use of pesticides on agricultural lands (i.e., Pembina sub-watershed).   |
|   | Uranium contamination   | Uranium mining in the Saskatchewan portion of the watershed.   |
|   | Surface Water allocations   | Minimum flows (Instream Flow Needs – IFNs) required for health of aquatic life.  |
|   | Groundwater allocations   | Oil sands activities create drawdown effect on aquifers and can decrease flows in watercourses, lakes, and wetlands.   |
| Groundwater contamination                 | Various contaminants migrating into the groundwater                                 | Pipeline leaks/spills, storage lagoons, farming, municipalities, mining operations, oil/gas production wells.  |
| Decreased dissolved oxygen concentrations | Pulp mill and wastewater treatment facility effluent discharges                     | Oxygen consuming substances in effluents lower dissolved oxygen levels stressing aquatic life.   |
| Acid rain                                 | Occurrence of acid rain from industrial/non-industrial activities (i.e., oil sands) | Result from discharges of sulphur dioxides (SO <sub>2</sub> ), nitrogen oxides (NO <sub>x</sub> ), and water.  |
| Proposed nuclear plant (Whitecourt area)  | Significant water consumption requirements  | Decrease in flows in the Athabasca.  |
|   | Operation includes various air and groundwater emissions                            | Air and groundwater emissions of radio nuclides, heavy metals, toxic organic compounds (dioxins/furans, hexachlorobenzene, ammonia).   |
|   | Disposal of radioactive waste   | It is not known how nuclear waste can be ultimately stored.  |
| Proposed nuclear plant (Whitecourt area)  | Human health concerns   | Studies have shown occurrences of cancer of those living close to nuclear facilities.  |
| Climate change                            | Increased temperatures  | May affect stream flows.   |
| Land impacts                              | Conventional oil & gas activities   | Seismic lines and well sites remove forested areas impacting runoff, flow conditions, and water quality.   |
|   | Oil sands   | Wetlands that typically regulate surface and groundwater flows and act as a natural filter are drained for oil sands activities.   |
|   | Forestry  | Increases water flow and flooding when water is plentiful, and decreases water flow in dry conditions.   |

### 3.5 OTHER WPAC SOW REPORTS

The Lesser Slave, Red Deer River and Old Man River SOW reports are good examples of SOWs created for watersheds in Alberta, which portray a comprehensive analysis of the health of the overall watershed and aquatic eco-system. Indicators chosen in these reports are easily understandable and relevant to the watershed.

The Lesser Slave watershed is a sub-watershed of the Athabasca watershed, and therefore has been included in the development of the draft indicators herein. Indicators in that SOW report were chosen to be indicative of changes related to the predominant pressures in the watershed including timber production, oil and gas exploration and development, livestock grazing, surface material removal, agriculture, recreation and settlement (Jamieson 2009). The indicators were identified and then classified as condition, pressure or response indicators, though no response indicators were chosen.

**Table 5 Lesser slave SOW indicators of watershed health and metrics (Jamison 2009).**

| Indicator Category |                | Metric  | Indicator Type     |
|--------------------|----------------|---|--------------------|
| Water              | Water Quality  | River Water Quality Index/Lake Trophic Status       | Condition          |
|                    |                | Escherichia coli                                    | Condition          |
|                    |                | Nutrient budget (P:N ratio)                         | Condition          |
|                    |                | Sediment contamination                              | Condition          |
|                    | Water Quantity | Water allocation (surface/ground/wastewater return) | Pressure           |
| Land use           |                | Riparian Health                                     | Condition          |
|                    |                | Linear Development - Stream Crossings               | Pressure           |
|                    |                | Land use inventory                                  | Condition/Pressure |
|                    |                | Livestock density                                   | Pressure           |
|                    |                | Wetland inventory                                   | Condition          |
| Biological         |                | Fish (population estimates)                         | Condition          |
|                    |                | Blue/green algae outbreaks (lake only)              | Condition          |

The Red Deer River watershed is the largest sub-watershed in the South Saskatchewan River basin (Aquality 2009). Originating in the Rocky Mountains the river flows through a diverse landscape which includes residential areas, oil and coal deposits, forests and croplands. About 43% of the land area in the watershed is used to raise crops and there are about 13,000 farms in the watershed making agriculture and its related impacts a dominant concern. In the Red Deer River SOW report, indicators were chosen to reflect the ecological integrity of the watershed and were categorized as condition indicators or risk indicators, condition indicators make comparisons against guidelines whereas risk indicators are comparative with other sub-watersheds (Table 6).

**Table 6 Indicators used in the Red Deer River SOW report.**

| Condition Indicators                | Risk Indicators                                   | Other (Water quality, water quantity and biological) |
|-------------------------------------|---|--|
| Wetland loss                        | Manure production                                 | Pipeline crossings and other structures              |
| Riparian health                     | Urban, agricultural and recreational developments | Pollution from point sources                         |
| Linear developments                 |   | Water discharge rates                                |
| Total phosphorus and total nitrogen | Oil and gas activity                              | Area of sub-watershed contributing to drainage       |
| Bacteria                            |   | Water allocations                                    |
| Parasites                           |   | Groundwater discharge/recharge areas                 |
| Pesticides                          |   | Wildlife diversity                                   |
| Land cover                          |   | Species listed under the Species at Risk Act         |
| Minimum flow                        |   |  |

The Oldman watershed health indicators were chosen “as general measures of environmental quality to show trends in environmental conditions” (OWC 2010). These indicators were chosen to measure aquatic health in relation to the predominant uses and concerns of the basin. Irrigated agriculture is the primary use of water in the watershed, with about 60% of the land devoted to agriculture, representing 40% of all irrigated land in Alberta (OWC 2010). The chosen indicators function much like performance measures and are broken down under the major topic headings of Terrestrial and Riparian Ecology, Water Quantity and Water Quality (OWC 2010). Indicators were also dependent on their potential to link to water management actions and are listed in the table below (Table 7).

**Table 7 Oldman watershed indicators (OWC 2010).**

| Terrestrial and Riparian Ecology | Water Quantity  | Water Quality                       |
|----------------------------------|---|-------------------------------------|
| Land cover                       | Trends in natural flow  | Nutrients (nitrogen and phosphorus) |
| Soil erosion rates               | Licensed allocation vs. natural flow  | Total Suspended Solids (TSS)        |
| Riparian health                  | Actual use vs. natural flow   | E.coli /fecal coliform              |
| Land use                         | Ability to meet Instream objectives and Water conservation objectives in recent years |                                     |
|                                  | Irrigation and municipal water use efficiency   |                                     |

### 3.6 PEACE-ATHABASCA DELTA STATE OF THE AQUATIC ENVIRONMENT REPORT

In 2002, a *State of the Aquatic Environment Report* was developed specifically for the Peace-Athabasca Delta, in response to the Northern River Basins Study.

This report developed and applied seven measurable indicators of ecosystem integrity (Donald *et al.* 2002). If one of the seven indicators was altered, then the integrity of the Peace-Athabasca Delta environment was also judged to be susceptible to change. These indicators were supported by a number of measurable variables and were chosen using eight criteria, including their relevance to the public, linkages to other components of the ecosystem, and availability of historical information.

Relative to other WPAC SOW reports that encompass entire watersheds and terrestrial and aquatic indicators, the indicators in this report were specific to the Peace-Athabasca Delta (PAD) and to the aquatic environment (Table 8). As the Athabasca watershed encompasses the PAD, these aquatic environment indicators were considered in the broader set of draft of indicators proposed herein.

**Table 8 PAD state of the aquatic environment indicators.**

| <b>Physical/Chemical</b>             | <b>Structural</b>                                  | <b>Functional</b>  |
|--------------------------------------|--|--|
| Climate and atmospheric contaminants | Clam shrimp abundance                              | None chosen though functional linkages exist between the chosen indicators |
| Water quality                        | Fish community structure (Mamawi and Claire lakes) |  |
| Lake Claire water levels             | Goldeye abundance                                  |  |
|                                      | Walleye and goldeye commercial catch               |  |

### 3.7 SUMMARY OF CONCERNS

#### 3.7.1 WPAC Development Process and Technical Committee

During the development of the Athabasca WPAC, members of the Council were asked to express their concerns (WPAC 2010). As well, during Phase 1, Technical Committee members provided key concerns found within the region were also considered (Hayward 2010). The highlighted concerns are outlined in the table below (Table 9). These concerns/issues were incorporated, where applicable and appropriate, in the draft indicators.

**Table 9 WPAC member issues and concerns (WPAC 2010).**

| <b>Concern</b>            | <b>Issue</b>   |
|---------------------------|--|
| Environmental             | Acid deposition from oil sands air emissions                           |
|                           | Aquatic ecosystem health (a key indicator of watershed sustainability) |
|                           | Ecological benchmark/reserve sites required                            |
|                           | Biodiversity loss  |
|                           | Climate Change   |
|                           | Cumulative environmental effects over long term                        |
|                           | Lack of data/information/facts   |
|                           | Invasive species (plant and animal)                                    |
|                           | Landscape sensitivity and protection of ecological significant areas   |
|                           | Pollution (water and air)  |
|                           | Reclamation of land (timing)   |
|                           | Stream erosion and sediment loads                                      |
|                           | Tailings pond leakage and reclamation                                  |
|                           | Vegetation communities and riparian habitat health                     |
|                           | Water quality impacts  |
|                           | Water quantity impacts (water levels and flow)                         |
|                           | Wetlands restoration   |
| Wildlife, species at risk |  |

**Table 9 (Cont'd.)**

| <b>Concern</b> | <b>Issue</b>   |
|----------------|--|
| Socio/Economic | Lack of awareness/education<br>Lack of communication<br>Development/land use – overdevelopment and lack of planning<br>Human health – downstream effects from tar sands and tailings ponds<br>Hunting and overhunting<br>Recreation – maintain trail and lake access and concern of OHV use of riparian areas<br>Social justice – downstream effects on FN/Métis communities<br>Water allocation/use and conservation<br>Watershed management – balance between environment and economic development |

### **3.7.2 Watershed Stewardship Group Sector Report #3**

In the winter/spring of 2010 Watershed Stewardship Group (WSG) representatives within the Athabasca watershed were interviewed to find out their concerns. Concerns relevant to the development of SOW report indicators included, but were not limited to:

- The use of the Athabasca River and the portion of the watershed in Jasper National Park, and associated environmental impacts;
- Climate change impacts on the Athabasca glacier;
- Water allocation and the impacts of water withdrawals;
- The impacts of new industrial development on water quality, watershed health, community sustainability, fish and wildlife, local landscape aesthetics, character and traditional use;
- Cumulative effects of contaminants released to the river;
- Water quality and quantity (low flows);
- Preservation of biological diversity; and
- Concerns about reports of elevated cancer rates in communities.

### **3.8 KEY THREATS AND PRESSURES IN THE ATHABASCA WATERSHED**

Based on the various reports reviewed (as noted in Section 3.3 to 3.7, above), and other research completed during Phase 1 of the Project, key threats and pressures identified include the following:

- *Projects Approved by AENV (EIAs)* - Since 2007, 11 projects (subject to Environmental Impact Assessments [EIAs]) within the watershed have been approved (AENV 2010b). All of these major projects fall within the lower Athabasca sub-watershed, with the exception of one coal mine expansion in the upper sub-watershed. The majority of the lower watershed projects were oil-sands developments (Steam Assisted Gravity Drainage (SAGD)/mines), with one limestone quarry/quick lime plant;

- **Proposed Project (AENV EIAs)** -As of December 2010, AENV has 14 current projects in various stages of review under the EIA process with all falling within the lower Athabasca sub-watershed, including 11 SAGD facilities/expansions and 3 oil-sands surface mines;
- **Coal mines** - Expansion of Sherritt Coal Valley mine and renewed operations in 2009 at the Obed mine in the McLeod sub-watershed, existing operations at Cardinal River (Cheviot) mine within the Upper Athabasca, and closure of Gregg River coal mine in the McLeod sub-watershed (ERCB 2010);
- **Forestry Industry/Pulpmills** - The Government of Alberta has predicted the forestry industry will continue to grow, at approximately 7% annually for the next three years (Government of Alberta 2010). Wastewater effluent is discharged from 4 existing pulpmills within the upper and middle portions of the watershed. Total production from the pulp and paper sector in Alberta increased approximately 9% from the 3<sup>rd</sup> quarter in 2009 to one year later in 2010 (AFPA 2010);
- **Expanding human settlements** - Fort McMurray experienced a growth rate of approximately 100% from 1999 to 2008 (RMWB 2010). In May 2010, a new sewage treatment plant was commissioned to serve a population of 100,000 with the option for expansion by another 33,000 as needed (Gilbert 2010). The next most significant growth rate was the town of Edson which grew by 16% over approximately 10 years from early in 2000 (Town of Edson 2009);
- **Proposed Enbridge Northern Gateway Pipeline** - Near Whitecourt, the proposed Northern Gateway Pipeline will transect the Athabasca watershed, with approximately 100 km of affected land and pipeline crossing of the Athabasca River and numerous other tributaries (ENGP 2010);
- **Swan Hills Special Waste Treatment Facility** - In 1996, there was a malfunction of a transformer furnace which caused process gases containing polychlorinated biphenyls (PCBs) and dioxins and furans (PCDD/Fs) to be released into the ambient air, which resulted in a fish consumption advisory. Although regular monitoring is done of the facility, the facility presents environmental risks, given it treats and manages hazardous waste (MRB 2003, AHW 2004);
- **Proposed Uranium Mines (Saskatchewan)** - Cameco Millennium Mine and Midwest Mining and Milling Project at McLean Lake are two proposed uranium mines in the Saskatchewan portion of the Athabasca watershed, upstream of Lake Athabasca.

Other factors such as growth rates of other major centres have been considered, with most centres falling more within a typical range: Athabasca, Whitecourt, Hinton have expanded from 5-10% (City of Hinton 2009; Whitecourt 2009; Town of Athabasca 2010). High Prairie and Slave Lake have seen growth rates below 5%.

These activities noted above have the potential to negatively affect the watershed's water quality, water quantity, undeveloped land base, and biodiversity. Indicators of these potential effects should be monitored to determine the extent of actual effects and/or provide a record of present conditions to be used comparatively in any future comparisons. The proposed set of indicators have been chosen to account for the current key pressures in the watershed, which may change over time.

### **3.9 RECOMMENDED INDICATORS OF WATERSHED HEALTH FOR THE AWC STATE OF THE WATERSHED REPORT**

#### **3.9.1 Core (Basin-wide) Indicators**

Recommended core (basin-wide) indicators of the state of the Athabasca watershed, for use in the Phase 2 AWC State of the Watershed report, are outlined in Table 10. These indicators are applicable to the entire watershed as a whole. Indicators specific to sub-watersheds are discussed in Section 3.9.2. It should be noted that, although a proposed nuclear power plant was identified as a key concern in Section 3.8, environmental impacts such as radioactive waste are not considered in the proposed indicators, given such a facility is still in the feasibility stages. If this becomes a reality, additional sub-watershed specific indicators may be required.

The watershed and sub-watershed draft indicators are outlined in Table 10 and were largely derived by:

- Assessing current anthropogenic activities and their spatial distribution in the watershed;
- Reviewing stakeholder concerns both from the 2008 Keepers of the Athabasca Report and from the AWC-WPAC and Watershed Stewardship Groups;
- Reviewing key research and literature conducted to-date in the watershed;
- Reviewing approved and proposed developments in the watershed; and
- Identification of environmental resources of ecological or social importance that were sensitive to change and could be reliably measured (see selection criteria in Section 2.2.2).

The metrics used to measure each indicator, relevant standards for comparison (where applicable), temporal periods for analyses, types of analyses, and suitability of data will be determined during Phase 2. Any limitations on the interpretation of existing data will be presented during Phase 2 of the Project, and is further discussed in Section 3.9.3.

**Table 10 Proposed core (basin-wide) indicators for Athabasca SOW report.**

| Themes                   | Indicator   | Details   | Type of Indicator | Rationale   |
|--------------------------|---|---|-------------------|---|
| Surface Water Quality    | Alberta River Water Quality Index (RWQI)*                 | Metals<br>Pesticides<br>Nutrients/Related Variables <sup>2</sup><br>Bacteria (Fecal coliforms, <i>E. coli</i> )   | Condition         | Industrial, municipal, agricultural impacts   |
|                          | Lake Water Quality (Trophic Status)*                      | Chlorophyll a<br>Phosphorus   | Condition         | Industrial, municipal, agricultural impacts   |
| Surface Water Quantity   | Annual River Flow Quantity Index*                         | Average natural flow vs. actual flows on a two-season basis (May–Sept and Oct–April) <sup>3</sup>   | Condition         | Industrial & municipal pressures  |
|                          | Allocations vs. Average Annual Flow*                      | Surface water licenses as a percentage of the total volume of surface water available at a given time   | Condition         | Industrial pressures  |
|                          | Historical Lake Level Index*                              | For Lakes AENV has already calculated index ( <a href="http://environment.alberta.ca/01719.html">http://environment.alberta.ca/01719.html</a> ) (i.e. Lake Athabasca, Lac Claire, Gregoire Lake, Lesser Slave Lake etc) | Condition         | Water usage and climate change impacts  |
|                          | Flow vs. Water Conservation Objective (WCO)* <sup>4</sup> | Flow vs. WCO which is set based on society's expectations and desired outcomes  | Condition         | Industrial & municipal pressures  |
| Sediment                 | Quality   | Metals<br>Pesticides<br>PAHs  | Pressure          | Industrial & municipal pressures, high natural levels in some areas (metals, PAHs)                        |
| Groundwater              | Groundwater Quality <sup>5</sup>                          | Metals<br>Pesticides<br>Nutrients/Related Variables<br>Bacteria ( <i>E. coli</i> )  | Condition         | Agricultural, industrial, conventional oil and gas/oil sands impacts                                      |
|                          | Well density* <sup>6</sup>                                | All licensed and unlicensed groundwater usage   | Condition         | Industrial, agricultural, municipal impacts   |
| Fisheries                | Mercury in Fish   | Mercury concentrations in fish  | Pressure          | Industrial Activity (mining), human health effects, high background levels, global atmospheric deposition |
|                          | Fish communities <sup>7</sup>                             | Abundance and diversity of fish populations   | Condition         | Industrial, municipal, agricultural impacts   |
| Wildlife                 | Terrestrial ranges  | Size of ranges  | Condition         | Industrial, municipal impacts   |
|                          | Waterfowl/bird abundance                                  | Waterfowl/bird inventory  | Condition         | Industrial, municipal impacts   |
| Anthropogenic activities | Land use*   | Oil/Gas well and pipeline densities   | Pressure          | Industrial impacts  |
|                          |   | Petroleum and natural gas agreements  | Pressure          | Industrial impacts  |
|                          |   | Converted and Accessed Forested Areas   | Pressure          | Industrial, municipal, agricultural impacts   |
|                          |   | Road Densities  | Pressure          | Industrial, municipal pressures   |
| Climate change           |   | Mean Annual and Seasonal Temperature (air)  | Condition         | Industrial, municipal, agricultural impacts   |
|                          |   | Precipitation as Snow (%) and total annual/seasonal (mm)  | Condition         | Industrial, municipal, agricultural impacts   |

**Table 10 (Cont'd.)**

\* AENV Draft Foundational Indicator.

- <sup>1</sup> The AENV RWQI consists of four sub-indices calculated annually for four variable groups (metals, nutrients, bacteria, and pesticides) and combines these values into a single descriptor of water quality. The AENV RWQI may not be applicable to all watersheds as the full suite of information may not be available to calculate an RWQI. During Phase 2 with a full data and literature review, it may be deemed more appropriate to report on water quality conditions using the individual sub-indices, most relevant to the issues in each sub-watershed. See <http://environment.alberta.ca/01275.html> for full list of variables within the AENV RWQI.
- <sup>2</sup> River Nutrient Index includes nitrogen, phosphorus, dissolved oxygen and pH. It is recommended these be reported for individually and as a sub-index.
- <sup>3</sup> This index should not be applied to any site with less than 30 consecutive years of flow data, ideally . 50 years of data is recommended by AENV.
- <sup>4</sup> Based on the future determination of a WCO for the Athabasca watershed and/or sub-watersheds.
- <sup>5</sup> The same variables are proposed for groundwater as those listed for the AENV RWQI, both as sub-indices and individual concentrations, where applicable to each sub-watershed as determined during Phase 2. TEK indicators have not been incorporated, but should be considered, where possible and appropriate, in development of the final set of indicators for Phase 2.
- <sup>6</sup> Water well density should include all known wells and unlike groundwater allocations/licenses is an indicator of total licensed and unlicensed water use as a reflection of the overall intensity of pressure on the resource (The *Water Act* states people may withdraw 1,250 m<sup>3</sup> annually for domestic/household use without the requirement for a license). It should be noted that mandatory reporting of water well drilling was only introduced in the late 1970s.
- <sup>7</sup> May not be suitable as an indicator in all watersheds due to lack of available data.

### 3.9.2 Sub-Basin-Specific Indicators

Indicators are proposed for specific sub-watersheds of the Athabasca basin that are specifically relevant to pressures in that sub-watershed rather than to the entire watershed (Table 11).

**Table 11 Additional sub-watershed indicators for Athabasca SOW report.**

| Themes                    | Indicator                             | Details                                | Type of Indicator | Rationale           | Sub-watershed               |
|---------------------------|---------------------------------------|--|-------------------|---------------------|-----------------------------|
| Surface Water             | Quality*                              | Selenium                               | Pressure          | Coal mine impacts   | McLeod                      |
|                           |                                       | Naphthenic acids**, PAHs               | Pressure          | Oil-sands impacts   | Lower Athabasca, Clearwater |
| Groundwater               | Groundwater allocations* <sup>1</sup> | Volumes allocated annually over time   | Pressure          | SAGD impacts        | Lower Athabasca, Clearwater |
| Anthropogenic Activities* | Land Use                              | Approved and proposed oil-sands leases | Pressure          | Oil sands impacts   | Lower Athabasca, Clearwater |
|                           |                                       | Coal agreements                        | Pressure          | Coal mining impacts | Upper Athabasca, McLeod     |

\* AENV Draft Foundational Indicator.

\*\* Data accuracy and availability consideration (see Section 3.9.3).

<sup>1</sup> Groundwater allocations are an indicator of total licensed volumes. It does not include unlicensed volumes (i.e., exemptions for 1,250 m<sup>3</sup> for household/domestic use). No data is available to compare the allocated volume and the volume of the source.

By looking at the indicators at a sub-watershed level, primary concerns can be examined on a more manageable scale and can be put into context relative to their immediate environment. Once the immediate (local) impacts are assessed, then downstream and cumulative impacts in the entire watershed can be better understood.

These sub-watershed indicators are predominantly in the lower portion of the watershed, with pressure-type indicators from industrial and agricultural activities. Aquifer drawdown is primarily a concern in the lower portion of the watershed due to the abundance of SAGD facilities which are water-intensive; therefore, groundwater allocations/withdrawals are a sub-watershed indicator for the Lower Athabasca and Clearwater sub-watersheds. Also in the Lower Athabasca, Central Athabasca (Lower), Clearwater, Lake Athabasca sub-watersheds, wetlands and oil-sands leases are interspersed throughout and are proposed as pressure-type indicators of watershed health.

The only sub-watershed specific indicator proposed outside of the lower portion of the watershed is livestock distribution, which is predominantly relevant in the Pembina sub-watershed, and portions of the Central Athabasca - Upper, and La Biche.

Figure 1 provides a summary of some of the key pressures within the watershed and proposed indicators of watershed health. The Preliminary Atlas in Appendix A2 provides further details on all attributes of the watershed.

**Figure 1 Athabasca Watershed water withdrawal, effluent discharge, and land use pressures.**

 b) Roads from Natural Resources Canada.  
 c) Pipelines and Wells from the Energy Resources Conservation Board.

### 3.9.3 Data Accuracy and Availability, and “Future Considerations”

As will be described in Section 4 (gap analysis), numerous indicators exist that may be useful for SOW reporting and tracking in the future, but may not be appropriate for immediate use in the Phase 2 SOW report, for reasons of data availability, inconsistency, or (less frequently) uncertainty. Two specific examples are given below, but many different datasets would qualify for inclusion in this list from a data availability/compatibility perspective.

**Naphthenic acids in surface waters (lower Athabasca River):** Naphthenic acids, a group of carboxylic acids described by the chemical formula  $C_nH_{2n+2}O_2$ , are thought to occur at relatively high concentrations in regional groundwater and particularly oil-sands tailings ponds in the lower Athabasca basin. As such, they have potential to be good indicators of any influences of tailings water that may occur in local surface waters. However, the current analytical science related to these compounds is in considerable flux. Recent studies using high-resolution methods (Grewer *et al.* 2010) have indicated that the majority of acid-extractable organic compounds previously measured as “naphthenic acids” in oil-sands tailings ponds, river waters, and even in commercial naphthenic acids preparations, are not actually naphthenic acids at all, but various other organic acids; in river waters, most compounds measured by this test may be environmentally ubiquitous fatty acids unrelated to oil-sands chemistry. Multiple commercial, academic and government laboratories are currently developing different analytical methods that may yield values from the same water samples that differ by orders of magnitude (see RAMP 2011 *in prep.* for further discussion). Because of this uncertainty in the analytical chemistry, there also are no longer meaningful toxicological benchmarks that may be used to properly assess these data. Therefore, although naphthenic acids may be a good indicator for use in future SOW reports (once the science has been clarified and new data have been collected), it may not be a good indicator to use at present.

**Benthic invertebrate community structure (basin-wide):** The structure and function of benthic invertebrate communities have historically been used as indicators or stress or effect in aquatic environments. Although numerous studies exist throughout different sub-basins of the Athabasca watershed that could be drawn on to assess aquatic ecosystem health in the Phase 2 SOW report, these datasets have not been collected using consistent methods or analytical approaches (i.e., sieve sizes, taxonomic resolution, etc.), and are not warehoused in any consistent (digital) data format in the province that would be available to the AWC for use in the Phase 2 SOW report. However, basin-wide collections of benthic invertebrate community data using standardized field, analytical, and reporting methods (typically collectively referred to as “regional bio-assessment” protocols) are an emerging monitoring tool in several large watersheds in Canada and elsewhere, and would be a meaningful approach to pursue in the Athabasca watershed from headwaters to mouth. However, this would require a very large data-collection effort that has not occurred to date. As such, this is a good indicator for future consideration. Fish-community data may be another example of a potentially meaningful basin-wide indicator that cannot yet be included in SOW reporting for similar reasons.

### **3.10 DEVELOPMENT OF A FINAL LIST OF INDICATORS FOR PHASE 2**

It should be noted that these watershed health indicators are considered preliminary, as they are based primarily on the scope of Phase 1, namely the spatial data collected, and a review of literature in the compiled bibliography. A thorough review of the bibliography will be required during Phase 2, which may require the indicators be revised. Pressures change and evolve over time and may also contribute to the need for revisiting the indicators during Phase 2.

As the TEK report has not yet been completed, TEK indicators have not been incorporated here. However, any TEK indicators suggested in the TEK report should be considered by AWC in the development of the final Phase 2 Terms of Reference.

Lastly, the number of indicators proposed above is much greater than the number of indicators typically included by other WPACs in their final SOW reports. A public report such as this must be short, concise, and engaging to the public, as well as being technically accurate and thorough. There is a trade-off between completeness and readability that must be considered by AWC when defining the final set of indicators for the Phase 2 report. As such, the list of suggested indicators presented in this Phase 1 report should, perhaps, be considered as a “long list”, from which a shorter list of representative and meaningful indicators may be drawn.

## 4.0 DATA AND KNOWLEDGE GAP ASSESSMENT

Based on the spatial data collected and Hatfield's knowledge of the Athabasca watershed, preliminary knowledge and data gaps have been identified which are essential to completion of Phase 2. These gaps were identified based on the availability of scientific data and a cursory literature review of the compiled bibliography. Gaps in TEK are identified in a separate TEK report. During Phase 2, with a thorough review of the bibliography and TEK sources, additional knowledge gaps may be identified and may need addressing.

In this context, missing "data" is intended to indicate a lack of specific observations describing a given feature, process, or activity. Missing "knowledge", in contrast, is intended to indicate a lack of general understanding of a feature or process. Knowledge gaps may be more serious than data gaps, and are usually more difficult and time-consuming to fill.

The gaps described herein include: general issues and challenges encountered during Phase 1 data collection; spatial data which were available but unobtainable; and gaps present in existing data and knowledge where future monitoring or research is recommended to provide a better understanding the state of the watershed.

### 4.1 OVERARCHING ISSUES

The overall issues and challenges encountered in data collection during Phase 1 include the following:

- General lack of publicly available government data in electronic form; lack of data-sharing between government agencies/departments;
- Lack of integration/harmonization of existing work being done within the watershed by various agencies, departments, stakeholders, academics, etc;
- Lack of a centralized location to obtain data;
- Lack of knowledge of cumulative effects at sub-watershed and whole watershed scales (e.g., instream flow needs [IFN], land fragmentation, climate change);
- Lack of knowledge and disagreement on ways to separate natural conditions from anthropogenic effects; and
- Lack of up-to-date baseline data that reflects current conditions and keeps pace with development (particularly with respect to land use, land cover).

### 4.2 SPECIFIC GAPS

Table 12 outlines data which were obtained but are considered 'incomplete' or could not be obtained in time for reporting, while Table 13 presents data/knowledge which currently does not exist in sufficiently comprehensive or useable form but would be valuable for future SOW reporting, and for environmental/watershed planning and management generally.

**Table 12 Preliminary data and knowledge gaps: incomplete information.**

| <b>Feature</b>      | <b>Gaps (Data/Knowledge)</b>  |
|---------------------|---|
| Surface Water       | <b>Data:</b> Incomplete datasets (allocations, consumptive use)                           |
| Groundwater         | <b>Data:</b> Aquifer type, groundwater levels, quality <sup>1</sup>                       |
| Wastewater Effluent | <b>Data:</b> Incomplete datasets (volume of discharge)                                    |
| Land                | <b>Data:</b> Vegetation/peatland inventory 2, wetland inventory 3, livestock distribution |

<sup>1</sup> Compiled data of all groundwater wells within the watershed from Alberta Water Well Information Database (AWWID) was requested but not obtained, however, the link to a limited number of AENV groundwater observation network wells within the watershed, with aquifer type and depth, is provided in the bibliography.

<sup>2</sup> Alberta Vegetation Inventory (AVI) is limited to areas of First Nation Reserves, Métis Settlements, and Parks. Forest Management Agreement (FMA) holders own the rights to their own AVI data, each FMA holder would need to be contacted individually to release their data.

<sup>3</sup> Data were requested but not obtained from Ducks Unlimited for coarse wetland ground cover classification (Contact: Al Richard, [A\\_Richard@ducks.ca](mailto:A_Richard@ducks.ca) (780) 489-8110). There is also a peatland inventory completed by the University of Alberta from the mid-1990s, which could not be obtained during Phase 1 (Contact: Richard Chabaylo, AENV).

**Table 13 Preliminary data and knowledge gaps: limited or no information.**

| <b>Feature</b> | <b>Gaps (Data/Knowledge)</b>   |
|----------------|--|
| Surface Water  | <p><b>Data:</b> Watershed-wide baseline water quality/aquatics data</p> <p><b>Data:</b> Fish species life histories</p> <p><b>Data:</b> Groundwater/surface water connections</p> <p><b>Data:</b> Drinking water quality on federal lands (reserves)</p> <p><b>Data:</b> PAHs in water (lower Athabasca River tributaries)</p> <p><b>Knowledge:</b> Naphthenic acids (basic science)</p> <p><b>Knowledge:</b> Tailings pond seepage, rates/effects (GW)</p> <p><b>Knowledge:</b> Oil sands/coal mine reclamation issues</p> <p><b>Knowledge:</b> Agricultural effects on water (withdrawals, releases)</p> |
| Groundwater    | <p><b>Data:</b> Unlicensed quantity (household/domestic use);</p> <p><b>Knowledge:</b> Groundwater management framework/cumulative impacts – quality/quantity</p> <p><b>Knowledge:</b> Tailings pond seepage, rates/effects</p>  |
| Land           | <p><b>Data:</b> Up-to-date current land cover</p> <p><b>Knowledge:</b> Oil sands/coal mine reclamation issues (liability, status)</p> <p><b>Knowledge:</b> Regularly updating of land use changes (disturbed vs. reclaimed lands), land use plan</p>   |
| Air            | <b>Data:</b> Aerial deposition sources and effects (esp. organics and metals), air-surface water connections   |
| People         | <p><b>Data:</b> Epidemiological data</p> <p><b>Knowledge:</b> Human health effects of development</p> <p><b>Knowledge:</b> Traditional land use/knowledge</p>  |

## 5.0 CONCLUSIONS AND RECOMMENDATIONS

The Athabasca watershed covers many biophysical zones and pressures including human settlements with municipal wastewater treatment plants, agriculture, forestry, and industrial activity (i.e., conventional oil and gas, oil sands facilities, and coal mines). These attributes vary significantly from the upper portion to the lower end of the watershed. As a result, the knowledge and data available varies significantly throughout the watershed and will make it challenging to assess the watershed as a whole during Phase 2.

As a result, suggested Watershed Health Indicators have been chosen both on a whole watershed, and sub-watershed specific basis and will be used in Phase 2, along with the compiled spatial and non-spatial science-based knowledge and TEK, to develop publicly oriented Athabasca State of the Watershed (SOW) Report.

A draft Terms of Reference for Phase 2 was presented separately to assist the AWC as a basis for moving forward with this next and final phase of SOW report development.

In the process of developing a State of the Watershed report—particularly in a watershed as large and complex as the Athabasca, and especially under the guidance of a large, multi-stakeholder committee—it will be easy and tempting to over-reach and try to include “everything important” in the report. Although it obviously is important to capture all key issues, it is equally important to ensure the report is written for its target audience: the engaged public. The SOW report, in its initial and future iterations, should be a mechanism for broader public and stakeholder engagement in watershed matters, not simply another long technical report filled with complex terminology that few people have the training or stamina to read.

Given the rapidly changing state of knowledge in the Athabasca watershed, particularly in its lower reaches, development of an SOW report that can be easily and quickly updated and revised in the future should be an explicit consideration of the form and structure of the Phase 2 report. As discussed in Hatfield’s proposal for this Phase 1 study, we feel that an interactive, web-served SOW report, rather than a static, paper report, best serves the dual purposes of encouraging the broadest stakeholder and public engagement and making the SOW a living document that can routinely be updated and modified as new information or knowledge emerges, and as conditions on the ground in the basin change.

## 6.0 CLOSURE

I trust the above Final Phase 1 Report meets your requirements and will provide a basis for discussion for Phase 2 with AWC. If any clarifications are required please contact the undersigned.

## PHASE 1: BIBLIOGRAPHY FOR AWC STATE OF THE WATERSHED REPORT

### ATHABASCA WATERSHED

| No. | Title   | Author  | Year | Journal / Publication | Accessed / Found  |
|-----|---|---|------|-----------------------|---|
| 1.  | An Initial Assessment of Aquatic Ecosystem Health in Alberta  | Alberta Environment (AENV), Edmonton, AB. Prepared by Anderson, A.-M., R. Casey, L.R. Noton, D. McDonald, C. Fraser, M. Raven, and North South Consultants Inc.         | n.d. | ---                   | Document provided on CD.<br>Accessed at:<br><a href="http://environment.gov.ab.ca/info/library/8023.pdf">http://environment.gov.ab.ca/info/library/8023.pdf</a> |
| 2.  | Trends in historical annual flows for major rivers in Alberta. Technical Report AE T/749.   | AENV, Edmonton, AB, Canada.   | 2004 | ---                   | Accessed at:<br><a href="http://www.environment.gov.ab.ca/info/library/6792.pdf">http://www.environment.gov.ab.ca/info/library/6792.pdf</a> .                   |
| 3.  | Information Synthesis and Initial Assessment of the Status and Health of Aquatic Ecosystems in Alberta, Surface Water Quality, Sediment Quality and Non-Fish Biota. Technical Report #278/279-01. | AENV, Water for Life, Edmonton, AB. Prepared by North/South Consultants Inc., Clearwater Environmental Consultants Inc. and Patricia Mitchell Environmental Consulting. | 2007 | ---                   | Accessed at:<br><a href="http://www.environment.alberta.ca/01300.html">http://www.environment.alberta.ca/01300.html</a> .                                       |
| 4.  | Analysis of Water Quality Conditions and Trends for the Long-Term River Network: Athabasca River, 1960-2007   | AENV  | 2009 | ---                   | Document provided on CD   |
| 5.  | Groundwater Observation Well Network  | AENV  | 2010 |                       | Accessed at:<br><a href="http://www.environment.alberta.ca/apps/GOWN/map.aspx">http://www.environment.alberta.ca/apps/GOWN/map.aspx</a>                         |

## ATHABASCA WATERSHED

| No. | Title   | Author  | Year  | Journal / Publication                          | Accessed / Found  |
|-----|---|---|-------|--|---|
| 6.  | Long-Term River Network and tributary water quality data                        | AENV  | 2010  | ---  | Documents provided on CD. Sent as Microsoft Excel files by D.LeClair, Surface Water Data Specialist, Alberta Environment, to A.Gilbride Hatfield Consultants. November 8, 2010.   |
| 7.  | Canadian Heritage Rivers System, Background Study of The Athabasca River, Draft | Alberta Environmental Protection and Members of the Athabasca River Background Study Steering Committee. Prepared by Randall Conrad & Associates Limited, Spencer Environmental Mgt. Services Ltd., Lilley Environmental Consulting, and Walt Kowal Consulting. | 1998  | ---  | Document provided on CD   |
| 8.  | Fish conservation strategy for Alberta: 2006-2010                               | Alberta Sustainable Resource Development (ASRD)   | 2006  | Obtained from ASRD. Date: November 2006: 30 pp | Accessed at:<br><a href="http://www.srd.alberta.ca/ManagingPrograms/FishWildlifeManagement/FisheriesManagement/documents/FishConservStrategy2006.pdf">http://www.srd.alberta.ca/ManagingPrograms/FishWildlifeManagement/FisheriesManagement/documents/FishConservStrategy2006.pdf</a> |
| 9.  | ASRD website: Status of Alberta Fish  | ASRD  | 2010a | ---  | Accessed at:<br><a href="http://www.srd.alberta.ca/BioDiversityStewardship/SpeciesAtRisk/SpeciesSummaries/StatusOfAlbertaFish/Default.aspx">http://www.srd.alberta.ca/BioDiversityStewardship/SpeciesAtRisk/SpeciesSummaries/StatusOfAlbertaFish/Default.aspx</a> .                   |
| 10. | ASRD website: Detailed Status Reports of Alberta's Wild Species.                | ASRD  | 2011  | ---  | Accessed at:<br><a href="http://www.srd.alberta.ca/BioDiversityStewardship/SpeciesAtRisk/DetailedStatus/Default.aspx">http://www.srd.alberta.ca/BioDiversityStewardship/SpeciesAtRisk/DetailedStatus/Default.aspx</a>   |

## ATHABASCA WATERSHED

| No. | Title  | Author   | Year | Journal / Publication                          | Accessed / Found  |
|-----|--|--|------|--|---|
| 11. | Bibliography of Athabasca River Basin (BARB)   | Athabasca River Basin Research Institute (ARBRI). Provided by Robert Holmberg, Ph.D., Professor Emeritus, Biology, Athabasca University<br>E-mail: robert@athabascau.ca<br>Telephone: (780) 675-6596 | 2010 | 20,500 references provided within from ARBRI.  | Document provided on CD   |
| 12. | Report of the Commissioner of the Environment and Sustainable Development to the House of Commons. The Commissioner's Perspective Main Points – Chapters 1 to 3 Appendix | Auditor General of Canada  | 2010 | ---  | Document provided on CD   |
| 13. | A comparison of trends in hydrological variables for two watersheds in the Mackenzie River basin   | Burn, D.H., O.I.A. Aziz and A. Pietroniro  | 2004 | Canadian Water Resources Journal 29(4):283-298 | Accessed at:<br><a href="http://www.ngps.nt.ca/Upload/PropONENT/Imperial%20Oil%20Resources%20Ventures%20Limited/River_Crossings/Documents/MGP_River_Crossings_Appendix_C1.pdf">http://www.ngps.nt.ca/Upload/PropONENT/Imperial%20Oil%20Resources%20Ventures%20Limited/River_Crossings/Documents/MGP_River_Crossings_Appendix_C1.pdf</a> |
| 14. | Climatic influences on streamflow timing in the headwaters of the Mackenzie River Basin  | Burn, D.H.   | 2008 | Journal of Hydrology 352:225-238               | Document provided on CD   |
| 15. | The Athabasca River  | Canadian Heritage Rivers System (CHRS)   | 2009 | ---  | Also accessible at:<br><a href="http://www.chrs.ca/Rivers/Athabasca/Athabasca-F_e.htm">http://www.chrs.ca/Rivers/Athabasca/Athabasca-F_e.htm</a> .  |
| 16. | Distribution of Contaminants in the Water, Sediment, and Biota in the Peace, Athabasca, and Slave River Basins: Present Levels and Predicted Future Trends               | Carey, J.H. Northern River Basins Study.   | 1997 | ---  | Asked Heather if she has a hardcopy<br>Available at a cost:<br><a href="http://publications.gc.ca/site/eng/64321/publication.html">http://publications.gc.ca/site/eng/64321/publication.html</a>  |

## ATHABASCA WATERSHED

| No. | Title  | Author   | Year | Journal / Publication   | Accessed / Found  |
|-----|--|--|------|---|---|
| 17. | Sediment dynamics and implications for sediment-associated contaminants in the Peace, Athabasca, and Slave river basins.                         | Carson, M.A. and H.R. Hudson   | 1997 | Northern River Basins Study Report 133 (ISSN 1192-3571).  | Available at a cost:<br><a href="http://publications.gc.ca/site/eng/61582/publication.html">http://publications.gc.ca/site/eng/61582/publication.html</a>           |
| 18. | Fish health in the Peace, Athabasca and Slave river systems  | Cash, K.J., W.N. Gibbons, K.R. Munkittrick, S.B. Brown, and J. Carey                               | 2000 | Journal of Aquatic Ecosystem Stress and Recovery 8:77-86  | Available at a cost:<br><a href="http://www.springerlink.com/content/u843945363029t05/">http://www.springerlink.com/content/u843945363029t05/</a>                   |
| 19. | Northern Rivers Ecosystem Initiative: Nutrients and Dissolved Oxygen-Issues and Impacts  | Chambers, P.A., J.M. Culp, N.E. Glozier, K.J. Cash, F.J. Wrona, and L. Norton.                     | 2006 | Environmental Monitoring and Assessment 113:117-141   | Accessed at:<br><a href="http://www.environmental-expert.com/Files/6063/articles/8584/1.pdf">http://www.environmental-expert.com/Files/6063/articles/8584/1.pdf</a> |
| 20. | Mackenzie Basin Impact Study (MBIS) Final Report   | Cohen, S.J. (Ed.). University of British Columbia and Environment Canada                           | 1997 | ---   | Document provided on CD. Also accessed at:<br><a href="http://www.taiga.net/mbis/MBIS_Final_Report.pdf">http://www.taiga.net/mbis/MBIS_Final_Report.pdf</a>         |
| 21. | Cumulative effects assessment for the Northern River Basins Study  | Culp, J.M., K.J. Cash and F.J. Wrona   | 2000 | Journal of Aquatic Ecosystem Stress and Recovery (Formerly Journal of Aquatic Ecosystem Health) Volume 8, Number 1, 87-94 | Available at a cost:<br><a href="http://www.springerlink.com/content/x3w112x8u912x236/">http://www.springerlink.com/content/x3w112x8u912x236/</a>                   |
| 22. | River2D. Two-Dimensional Depth Averaged Model of River Hydrodynamics and Fish Habitat. Introduction to Depth Averaged Modeling and User's Manual | Cumulative Environmental Management Association (CEMA). Prepared by Steffler, P. and J. Blackburn. | 2002 | ---   | Document provided on CD   |
| 23. | Temporal variations in river-ice break-up over the Mackenzie River basin, Canada   | de Rham, L.P., T.D. Prowse and B.R. Bonsal   | 2008 | Journal of Hydrology 349:441-454  | Document provided on CD   |

## ATHABASCA WATERSHED

| No. | Title   | Author  | Year | Journal / Publication   | Accessed / Found  |
|-----|---|---|------|---|---|
| 24. | Contaminants in environmental samples: mercury in the Peace, Athabasca and Slave Rivers. Project Report No. 105. Edmonton.  | Donald, D.B., H.L. Craig and J. Syrgiannis  | 1996 | ---   | Available at a cost:<br><a href="https://isbndb.com/d/book/contaminants_in_environmental_samples_a01.html">https://isbndb.com/d/book/contaminants_in_environmental_samples_a01.html</a> |
| 25. | Development of a New Approach to Cumulative Effects Assessment: A Northern River Ecosystem Example  | Dube, M., B. Johnson, G. Dunn, J. Culp, K. Cash, K. Munkittrick, I. Wong, K. Hedley, W. Booty, D. Lam, O. Resler, and A. Storey | 2006 | Environmental Monitoring and Assessment (2006) 113: 87-115      | Document provided on CD   |
| 26. | Climatic and hydrologic variability during the past millennium in the eastern Rocky Mountains and northern Great Plains of western Canada                                     | Edwards, T.W.D., S.J. Birks, B.H. Luckman, and G.M. MacDonald   | 2008 | Quaternary Research (ScienceDirect)                             | Document provided on CD   |
| 27. | Northern Ecosystem Initiative Final Report: Building Capacity and Delivering Results  | Environment Canada  | 2004 | ---   | Accessed at:<br><a href="http://www.ec.gc.ca/nature/default.asp?lang=En&amp;n=18938173-1">http://www.ec.gc.ca/nature/default.asp?lang=En&amp;n=18938173-1</a> .                         |
| 28. | Northern Rivers Ecosystem Initiative Key Findings   | Environment Canada  | 2004 | ---   | Document provided on CD   |
| 29. | Elevated mercury concentrations in fish in lakes in the Mackenzie River Basin: The role of physical, chemical and biological factors  | Evans, M.E., W.L. Lockhart, L. Doetzel, G. Low, D. Muir, K. Kidd, G. Stephens, and J. Delaronde                                 | 2005 | Science of The Total Environment 351-352:479-500                | Available at a cost:<br><a href="http://www.ncbi.nlm.nih.gov/pubmed/16183101">http://www.ncbi.nlm.nih.gov/pubmed/16183101</a>   |
| 30. | Lower Athabasca Regional Council datasets (recommended land-use classifications, multi-use corridors, agricultural areas, conservation areas, forest management tenures, etc) | Government of Alberta, GeoDiscover Alberta portal   | 2011 | First iteration of public portal, launched on January 31, 2011. | Available at:<br><a href="http://xnet.env.gov.ab.ca/portal_public/ptk">http://xnet.env.gov.ab.ca/portal_public/ptk</a>  |
| 31. | Northern River Basins Study   | Government of Canada and Government of Alberta (and Government of North West Territories)                                       | 1996 | ---   | Available at:<br><a href="http://www3.gov.ab.ca/env/water/nrbs/toc.html">http://www3.gov.ab.ca/env/water/nrbs/toc.html</a> .  |
